# Accounting and Regulatory Context

WILARY WINN

# Context for CECL

- **Why was CECL implemented?**
  - Response to the **2008 financial crisis**
  - Forward looking estimates
  - **Goal:** timely recognition of expected credit losses
- **Key Features of CECL**
  - Allowance for Credit Losses
  - Broad Application
- **Regulatory Guidance Highlights (FDIC):**
  - Institutions must use a **broader range of data** to estimate lifetime credit losses
  - Estimation approaches that build on **existing credit risk management systems**
  - CECL is **scalable** to institutions of all sizes

## CECL Applies to:

- Loans
- HTM Securities
- Net Investment in leases
- Off balance sheet credit exposures
- Loan commitments
- Standby letters of credit
- Financial guarantees/similar instruments

# Major Provisions

- Departs from incurred loss model – probable threshold removed and CECL results in day one life of asset loss recognition
- Loss is recognized through an allowance for financial assets, including HTM debt securities, and through a liability for off balance sheet exposures
- Changes in the allowance – positive and negative are recorded immediately through credit loss expense

# Measuring Credit Losses

- Net carrying amount should be based on the cash flows an entity expects to collect
- Contractual cash flows are adjusted for expected prepayments and defaults
  - Cash flows should not be adjusted for extensions, renewals, or modifications unless a TDR is reasonably expected
- Cash flows expected to be collected are discounted at the effective interest rate when using a discounted cash flow method
  - Credit loss is carrying amount less present value of expected cash flows
- Measure expected losses on a pool basis whenever similar risk characteristics exist

# Estimating Expected Credit Losses

- Consider relevant information – internal and external
- Do not rely solely on past events – adjust historical loss information for:
  - Current asset specific risk characteristics
  - Current conditions
  - Reasonable and supportable forecasts
- Life of loan estimate – to estimate losses after reasonable forecast time period revert to historical loss rates

# Regulatory Perspective

- Standard does not specify a single method for measuring expected credit losses
- Smaller and less complex institutions do not have to use costly and complex models
- Institutions may apply different modeling methods to different groups of financial assets

# SAB 119 & AICPA CECL Practice Aid

- **Staff Accounting Bulletin No. 119:** Provides updated guidance on measuring current expected credit losses (CECL) under ASC Topic 326, focusing on systematic methodologies and the necessary documentation for allowance estimates. Emphasizes governance and internal control considerations.
- **Moss Adams guide to CECL**
- **AICPA CECL Practice Aid:** Offers audit considerations for CECL, focusing on internal controls, data reliability, model assumptions, and audit committee oversight.

# Non-Linear Loss Rates

# Use of Data

**WILARY WINN**

# Data Considerations

- Predictive Inputs – Correlation is Not Causation
- Granularity
- Relevant lookback periods
- Use of industry data to supplement

# Correlation is not Causation

**Per capita consumption of mozzarella cheese**  
correlates with  
**Civil engineering doctorates awarded**

Correlation: 95.86% ( $r=0.958648$ )

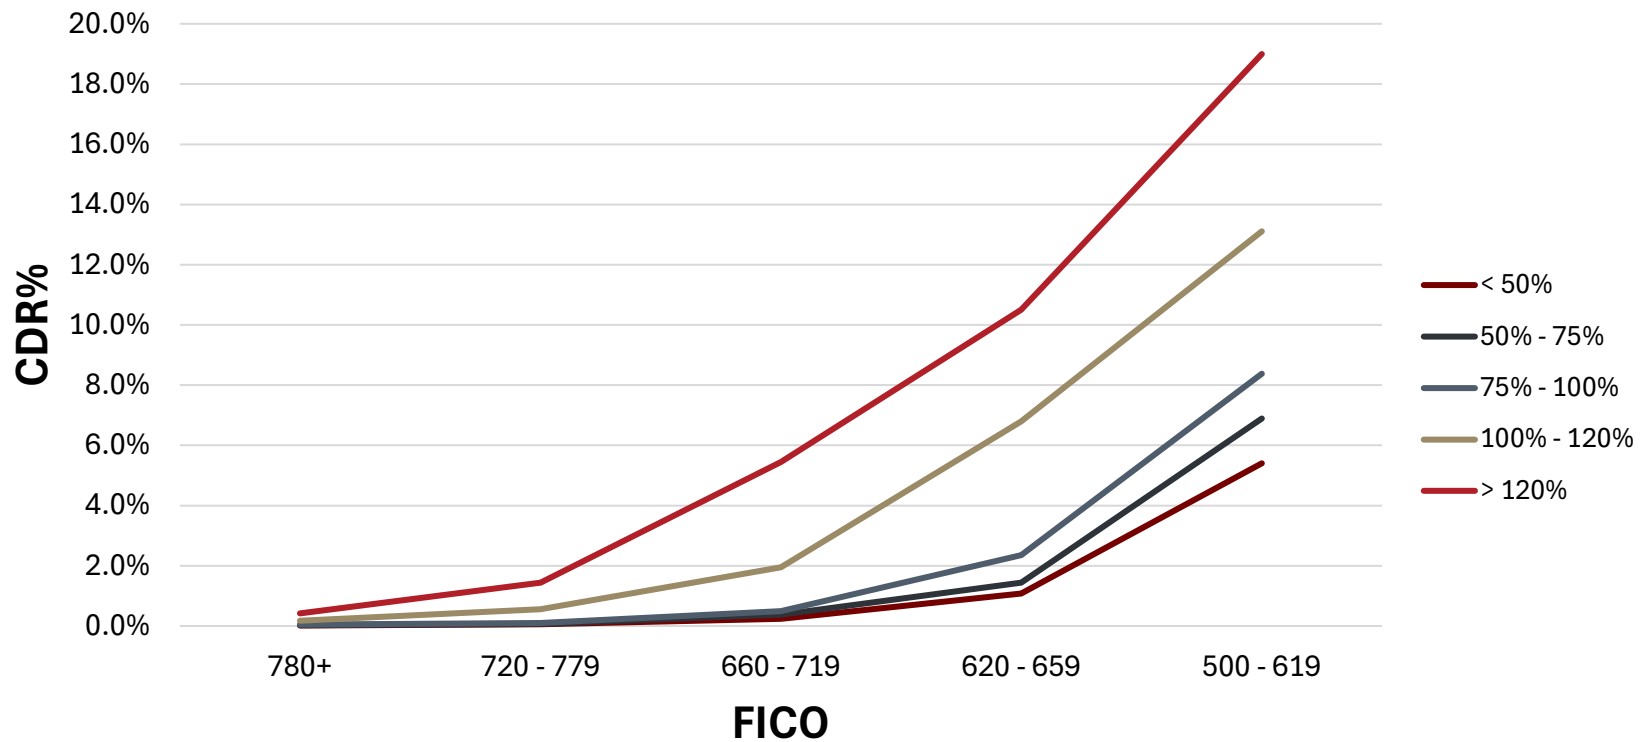

## Examples– Performance of:

- Residential real estate loans is highly correlated to FICO **and** CLTV
- CRE is highly correlated to DSCR **and** LTV
- C & I loans is correlated to industry
- Auto loans is highly correlated to type of loan, FICO score loan term, and unemployment rate

# Predictive Inputs

**Average CDR% by LTV% and FICO**

## Residential Real Estate Loans

- Housing Market Sensitivity
- Creditworthiness of Borrowers:
  - Credit scores (FICO)
  - Loan-to-value ratios (LTV)
- Prepayments
- Market Volatility

## Commercial Loans

- Borrower Credit Quality
- Industry-Specific Risks:
  - Retail
  - Hospitality
  - Office
  - Manufacturing
- Collateral and Guarantees
- Loan Structuring:
  - Balloon payments
  - Variable interest rates
  - Lines of credit

# CRE Loss Rates

**Multifamily Loss Rates by DSCR and LTV**

# Loan Stratification – Cohort NAICs

## SBA Charge-Off Rates by NAICS Code

| NAICS Description   | 2007 | 2008 | 2009 | 2010 | 2011 | 2012 |
|---------------------|------|------|------|------|------|------|
| Bowling Centers     | 2.49 | 3.66 | 4.81 | 6.07 | 1.37 | 7.17 |
| Car Washes          | 2.37 | 7.28 | 9.00 | 9.21 | 3.18 | 3.48 |
| Gasoline Stations   | 2.57 | 4.14 | 6.55 | 7.55 | 3.83 | 4.04 |
| Hotels and Motels   | 1.75 | 3.45 | 5.03 | 7.91 | 3.31 | 3.00 |
| Machine Shops       | 1.22 | 3.59 | 4.09 | 3.29 | 2.03 | 1.32 |
| Offices of Dentists | 0.84 | 2.28 | 4.13 | 3.60 | 1.50 | 1.77 |
| Offices of Lawyers  | 0.60 | 1.89 | 1.89 | 4.13 | 2.14 | 0.66 |
| Veterinary Services | 0.23 | 0.70 | 1.95 | 0.63 | 1.15 | 0.41 |

## Agricultural Loans

- **Unique Risk Profile**
  - Seasonal cash flow variability
  - Commodity prices
  - Weather conditions
  - Government policies
- **Collateral Valuation Challenges**
- **Geographic Sensitivity**

## Consumer Loans

- Shorter Loan Terms
- Credit Risk Variability
- Unsecured Nature
- Macroeconomic Sensitivity

# Loan Stratification - Cohort

| Collateral Type         | FICO Cohort | CRR %  | CDR % | Severity % | Future Loss % |
|-------------------------|-------------|--------|-------|------------|---------------|
| New Vehicle - Direct    | 680 - 719   | 18.03% | 0.28% | 31.28%     | 0.17%         |
| Used Vehicle - Direct   | 680 - 719   | 18.04% | 0.64% | 30.91%     | 0.35%         |
| New Vehicle - Indirect  | 680 - 719   | 18.09% | 0.44% | 34.08%     | 0.32%         |
| Used Vehicle - Indirect | 680 - 719   | 17.90% | 0.88% | 33.82%     | 0.59%         |

# Granularity

- The more granular the more predictive
- Statistically valid sample
- Creditability theory

# Loan Stratification – Cohort

| Collateral Type                            | CRR %  | CDR %  | Severity % |
|--|--------|--------|------------|
| Used Vehicle - Direct Current 780+         | 17.91% | 0.05%  | 29.30%     |
| Used Vehicle - Direct Current 760-779      | 18.02% | 0.14%  | 30.12%     |
| Used Vehicle - Direct Current 720-759      | 18.12% | 0.35%  | 29.96%     |
| Used Vehicle - Direct Current 680-719      | 18.04% | 0.64%  | 30.91%     |
| Used Vehicle - Direct Current 640-679      | 17.34% | 1.72%  | 31.88%     |
| Used Vehicle - Direct Current 620-639      | 16.09% | 2.99%  | 31.20%     |
| Used Vehicle - Direct Current 500-619      | 13.05% | 6.60%  | 31.82%     |
| Used Vehicle - Direct Current under 500    | 7.47%  | 23.00% | 29.13%     |
| Used Vehicle - Direct Delinquent 30-59     | 4.00%  | 33.64% | 30.24%     |
| Used Vehicle - Direct Delinquent 60-89     | 4.00%  | 68.99% | 35.47%     |
| Used Vehicle - Direct Delinquent 90+ & F/C | 4.00%  | 79.45% | 37.02%     |

# Questions So Far?

# CECL MODELS

**WILARY WINN**

# Modeling Techniques

- Permits allowance calculation to be based on methods which “implicitly” include the time value of money
  - DCF explicitly considers time value of money
  - Loss-rate, roll-rates, probability of default methods, and provision matrices implicitly consider discount
- Contemplates use of mean and not mode if using statistical modeling
- Should be based on financial institution’s lending strategy, loan portfolio composition and concentration

## Overview of CECL Models

1. Snapshot
2. Vintage
3. Migration
4. Probability of Default & Loss Given Default (PD/LGD)
5. Weighted Average Remaining Maturity (WARM)
6. Discounted Cash Flow (DCF)

# Available CECL Models

## Snapshot Model

- Groups loans or financial assets with similar risk characteristics into pools.
- Typically used for homogeneous loan groups.
- Expected credit losses are calculated by analyzing the pool's historical performance.
- One of the simplest methodologies.
- Requires significant analysis to support qualitative factors.

| CECL Example: Snapshot Methodology |                |                                    |                 |
|------------------------------------|----------------|------------------------------------|-----------------|
| Year End                           | Amortized Cost | Net COs From 2018 Snapshot Balance | Calculation     |
| 2019                               | 100,000,000    | -                                  | A               |
| 2020                               | 92,049,543     | 150,000                            | B               |
| 2021                               | 83,701,562     | 260,000                            | C               |
| 2022                               | 74,936,183     | 270,000                            | D               |
| 2023                               | 65,732,534     | 50,000                             | E               |
| 2024                               | 56,068,704     | -                                  | F               |
| 2019 Pool's Cumulative Net COs     |                | 730,000                            | G = SUM (A : F) |
| 2019 Amortized Cost                |                | 100,000,000                        | A               |
| Unadjusted Net CO Rate             |                | 0.73%                              | H = G / A       |
| Qualitative Adjustments            |                | 0.25%                              | I               |
| Total ACL % for 2024               |                | 0.98%                              | J = H + I       |
| 2024 Amortized Cost                |                | 56,068,704                         | F               |
| Total ACL \$ for 2024              |                | 549,473                            | L = J x F       |

# Available CECL Models

## Vintage Model

- The **Vintage Model** tracks credit losses based on the origination date (or "vintage") of the loans.
- Credit losses are estimated based on the historical performance of each vintage cohort.
- Provides insights into how different economic cycles or underwriting standards impact losses over time.

| CECL Example: Vintage Methodology |            |                 |        |        |        |        |                              |                               |
|-----------------------------------|------------|-----------------|--------|--------|--------|--------|------------------------------|-------------------------------|
| Origination                       |            | Net Charge-Offs |        |        |        |        | Remaining                    | Remaining                     |
| Vintage                           | Amount     | Year 1          | Year 2 | Year 3 | Year 4 | Year 5 | Lifetime Net Charge-Offs (%) | Lifetime Net Charge-Offs (\$) |
| 2019                              | 22,000,000 | 0.03%           | 0.42%  | 0.24%  | 0.12%  | 0.03%  | n/a                          | n/a                           |
| 2020                              | 19,000,000 | 0.03%           | 0.69%  | 0.30%  | 0.18%  | 0.03%  | 0.03%                        | 5,700                         |
| 2021                              | 15,000,000 | 0.01%           | 0.24%  | 0.12%  | 0.15%  | 0.03%  | 0.18%                        | 27,000                        |
| 2022                              | 17,000,000 | 0.02%           | 0.30%  | 0.22%  | 0.15%  | 0.03%  | 0.40%                        | 68,000                        |
| 2023                              | 14,000,000 | 0.01%           | 0.41%  | 0.22%  | 0.15%  | 0.03%  | 0.81%                        | 113,750                       |
| 2024                              | 13,000,000 | 0.02%           | 0.41%  | 0.22%  | 0.15%  | 0.03%  | 0.83%                        | 108,277                       |

|                                 |            |
|---------------------------------|------------|
| Unadjusted Net Charge-Offs (\$) | 322,727    |
| 2024 Amortized Cost             | 56,068,704 |
| Unadjusted Net Charge-Offs (%)  | 0.58%      |
| Qualitative Adjustments         | 0.25%      |
| Total ACL % for 2024            | 0.83%      |
| Total ACL \$ for 2024           | 462,899    |

# Available CECL Models

## Migration Model

- The **Migration Model** tracks the movement of loans between credit risk categories (e.g., risk ratings).
- Focuses on credit quality changes.
- Migration patterns combined with forward-looking forecasts

| CECL Example: Migration Methodology |                    |                  |              |                    |                  |
|-------------------------------------|--------------------|------------------|--------------|--------------------|------------------|
| Risk Rating                         | 2019 Balance       | Pool Losses      | Loss Rate    | 2024 Balance       | Expected Losses  |
| 1                                   | -                  | -                | 0.00%        | -                  | -                |
| 2                                   | 8,000,000          | -                | 0.00%        | 12,000,000         | -                |

## Probability of Default & Loss Given Default (PD/LGD) Model

- The **PD/LGD Model** estimates credit losses by calculating two key components:
  - Probability of Default (PD)
  - Loss Given Default (LGD)
- PD is typically estimated using historical data.
- LGD is calculated using historical recovery rates in the event of default.

| CECL Example: PD/LGD Methodology |               |                |                       |                        |                    |
|----------------------------------|---------------|----------------|-----------------------|------------------------|--------------------|
| Year                             | Average Loans | Net Charge-Off | Non-Performing Assets | Probability of Default | Loss Given Default |

## Weighted Average Remaining Maturity (WARM) Model

- The **WARM Model** estimates expected credit losses based on the weighted average remaining maturity.
- Applies historical loss rates to project future losses over the remaining life.
- The WARM model calculates a pool's weighted average remaining maturity based on contractual attributes, adjusted for prepayment assumptions.

| CECL Example: WARM Methodology |                      |                    |                              |                   |              |

## Discounted Cash Flow (DCF) Model

- The **Discounted Cash Flow (DCF) Model** estimates expected credit losses by projecting the future cash flows.
- The DCF model forecasts expected cash flows (including principal and interest payments) based on current conditions and reasonable and supportable forecasts.
- The difference between the amortized cost and the discounted cash flows represents the expected credit loss.

### Why It Is Superior:

The DCF model is considered highly reliable because it:

- Incorporates forward-looking information.
- Considers the time value of money.
- Works well for complex portfolios and assets with variable cash flows.
- Ensures a comprehensive view of credit risk by integrating multiple factors.

# Relevant Definitions

**Probability of Default (PD):** The likelihood that a borrower will default on a loan within a given time period, typically expressed as a percentage.

**Loss Given Default (LGD):** The percentage of the loan balance that is expected to be lost if the borrower defaults, after considering recoveries such as collateral or guarantees.

**Exposure at Default (EAD):** The total outstanding balance or amount at risk at the time of default, including both principal and accrued interest.

**Conditional Repayment Rate (CRR):** Annual amount of expected voluntary payoffs as a percentage of the principal amount outstanding at the beginning of the year.

**Conditional Default Rate (CDR):** Annual amount of expected defaults as a percentage of the principal amount outstanding at the beginning of the year.

**Conditional Prepayment Rate (CPR):** Annual percentage of expected voluntary and involuntary payoffs (defaults).  $CRR\% + CDR\% = CPR\%$ .

**Loss Severity:** Loss Severity expected on a loan that does go into default. This is equal to the liquidated Principal Balance minus any recovered amount divided by the Principal Balance. Severity % is the inverse of a recovery rate. Synonymous with LGD.

WILARY WINN

# WARM vs. DCF Comparison

| WARM vs. DCF Comparison             |  |   |
|-------------------------------------|--|---|
| Aspect                              | WARM Model   | DCF Mode  |
| <b>Methodology</b>                  | Applies historical loss rates over the remaining life of the loan pool.                            | Projects future cash flows and discounts them to present value to estimate credit losses.                           |
| <b>Macroeconomic Considerations</b> | Limited integration of forward-looking data; relies heavily on historical loss rates.              | Fully integrates past events, current conditions, and forward-looking macroeconomic forecasts.                      |
| <b>Credit Loss Calculation</b>      | Combines probability of default and loss severity in a single aggregate loss rate.                 | Models default probability and loss severity separately, enhancing accuracy and granularity.                        |
| <b>Data Granularity</b>             | Uses broad categories, aggregating loans with different terms, credit scores, and LTVs.            | Analyzes loans individually or in detailed cohorts, incorporating updated borrower credit and collateral data.      |
| <b>Model Complexity</b>             | Simple and retrospective; focuses on historical loss rates applied to weighted average maturities. | Prospective and dynamic, incorporating detailed loan-level attributes and changing conditions.                      |
| <b>Prepayments</b>                  | Prepayments are often misestimated based on historical data, leading to inaccuracies.              | Prepayments are modeled directly based on borrower incentives, market interest rates, and updated loan information. |
| <b>Use Cases</b>                    | Primarily for estimating reserves in a straightforward manner; lacks versatility.                  | Can be used for multiple purposes beyond reserve estimation, including ALM, stress testing, and loan pricing.       |
| <b>Adjustments</b>                  | Requires significant qualitative and environmental adjustments to account for model limitations.   | Typically requires fewer adjustments due to its granularity and incorporation of current and forecasted conditions. |
| <b>Predictive Power</b>             | Less predictive, especially during economic stress, due to reliance on retrospective data.         | Highly predictive, adjusting dynamically to changes in borrower creditworthiness and economic forecasts.            |

## WARM vs. DCF Comparison (cont.)

Some of the most important elements within the CECL framework are the:

1. Need to include macroeconomic considerations.
2. Requirement to use relevant forward-looking information.
3. Requirement that if outside of industrywide data is used, it must be relevant and reliable.
4. Life-of-loan calculations and need to consider prepayments.

# WARM vs. DCF Comparison (cont.)

- Most models, including WARM, are based on the total loss rate.
- Loss rates are not linear.
- In practice, this means that the more granular the model, the more predictive it is.
- Credit scores migrate over time, and collateral values change as well.

| Loan Amount      | FICO       | LTV        | CDR           | Severity       | CECL Reserve (\$) | CECL Reserve (%) |

## WARM vs. DCF Comparison (cont.)

- Net provision expense totals approximately \$21 million over the 14-year period.
- The WARM method grossly understates the required reserve in 2009 and does not release enough reserve in 2014.

# Questions So Far?

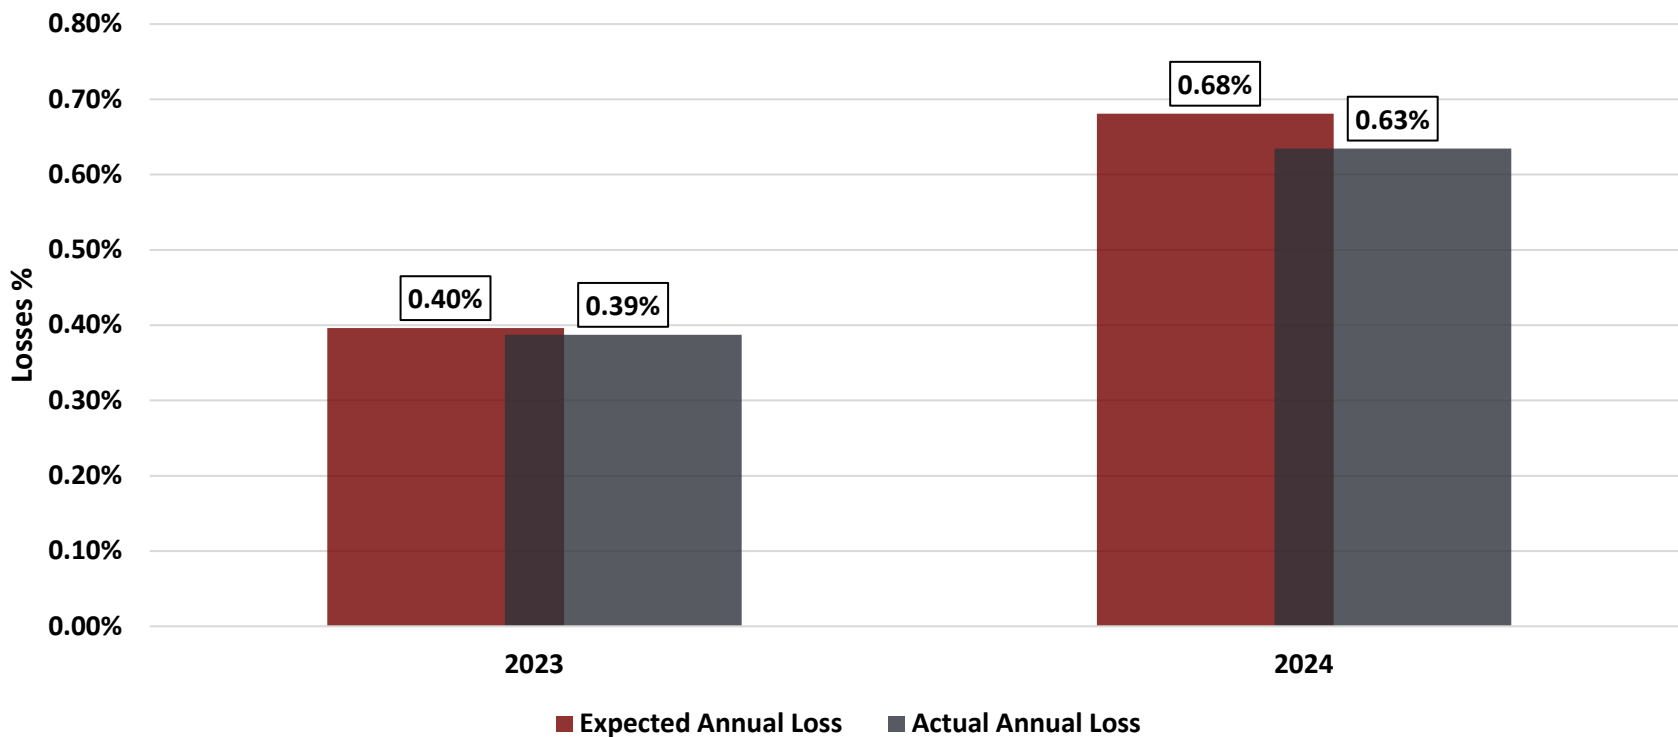

# WW Proprietary Model

WILARY WINN

# WW Proprietary Model Results

## Back-Tested Loss Accuracy: Predicted vs. Actual

The results show that our models are highly predictive:

- For the year 2023, we predicted 0.40% of losses – actual net charge-offs were 0.39%.
- For the year 2024, we predicted 0.68% of losses – actual net charge-offs were 0.63%.

# Discounted Cash Flow Analysis

It is very important to note that while we are applying our statistical inputs at the loan level in order to achieve a more accurate result for the aggregated cash flows, we do not for a moment believe our results are accurate for any given loan. In fact, we show a small percentage of each loan prepaying and defaulting each year – the latter, of course, being impossible. We are not re-underwriting individual loans, we are applying inputs – prepayment rates, default rates and loss given defaults, which we have derived from our statistical analysis to a pool of loans. Our results are intended to be accurate and to be used only in the aggregate.

# Discounted Cash Flow Analysis

## Key Valuation Inputs:

- Conditional Repayment Rate (CRR)
- Conditional Default Rate (CDR)
- Conditional Prepayment Rate ( $CPR = CRR + CDR$ )
- Loss Severity
- Discount Rate – depends on accounting context. For CECL it is original yield

## Data-Driven Default Assumptions by Loan Segment

### Calibrated Using Historical Loan Performance and Borrower Risk Factors

- Initial CDRs are derived using a proprietary loan-level dataset spanning from 2008 through today, capturing full economic cycles.
- Based on individual loan characteristics including credit score, LTV/CLTV, term, loan type, and delinquency status.
- Assumptions applied at the loan-level based on these same characteristics.
- Historical performance trends inform segmentation logic, with higher CDRs assigned to loans exhibiting elevated risk (e.g., lower credit scores, higher LTVs, delinquency).
- Results are thus tailored to the characteristics of any given loan portfolio, adjusting dynamically as these attributes change.

## Predictive Inputs

### Unemployment Rates

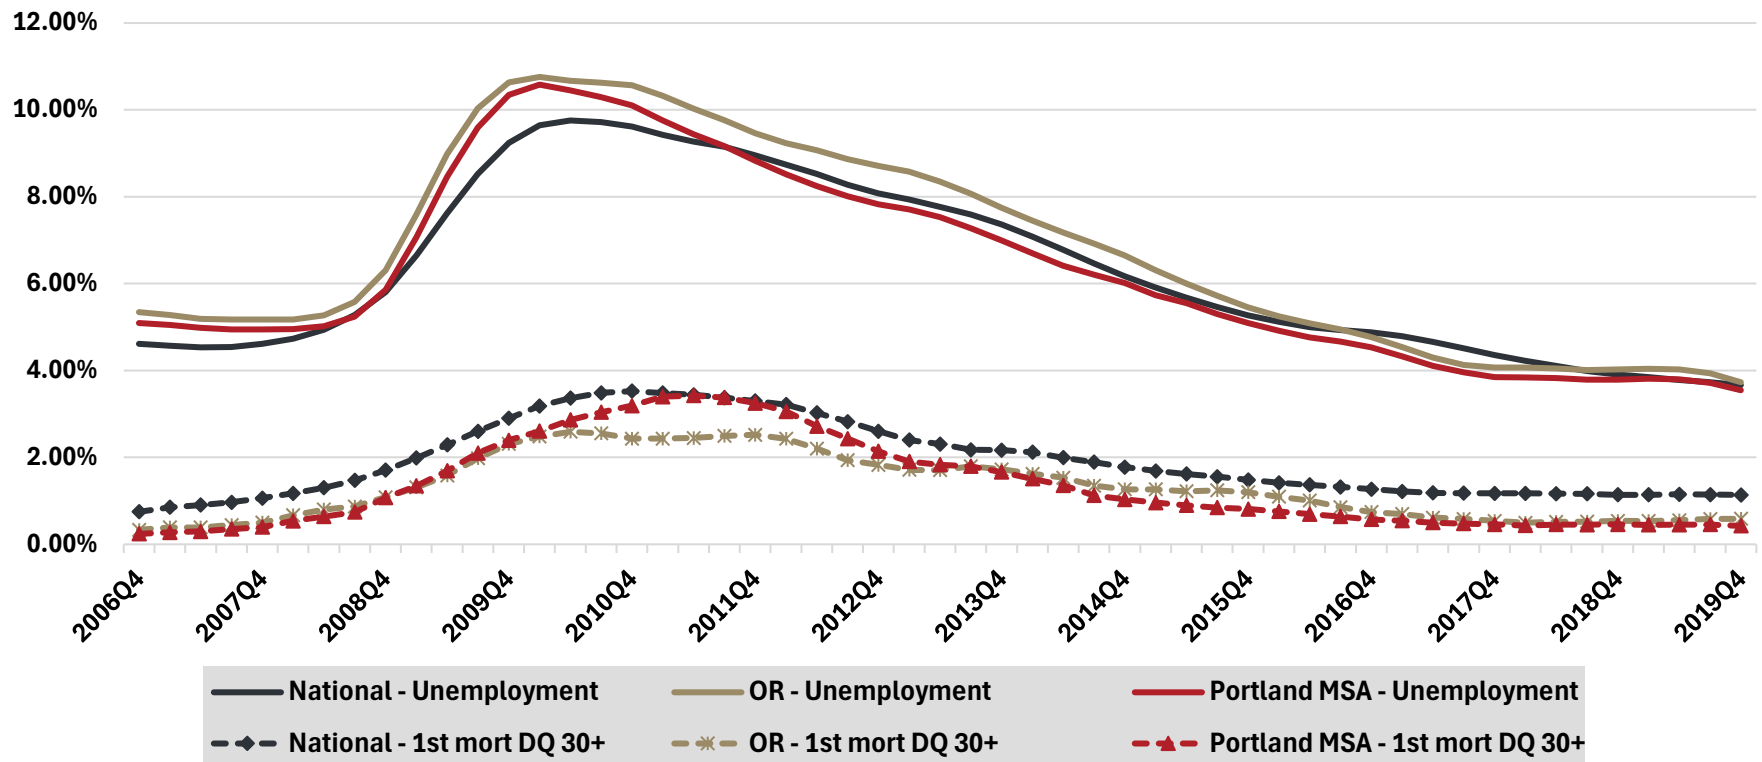

## Predictive Inputs

Quantifying the relationship between unemployment and defaults:

- Perform regression analysis to determine best fit trend line including beta and R-squared
- Perform roll rate analysis to determine estimated default rates for any given unemployment rate
- Utilize changes between scenarios to determine default factors

## Predictive Inputs

### DQ Status vs. Unemployment

# Modeled Default Rates

# Credibility Theory

New Estimator =  $Z \times \text{Company Estimator} + (1 - Z) \times \text{Prior (Industry) Estimator}$

$K = n/(n+k)$  where for some quantity  $k$  and company sample size  $n$

$k = 4/(L^2 * \text{Prior Estimator})$

Here, "L" is the proportion desired (margin for error as a proportion or  $M/\pi$  per the previous slide).

# Credibility Theory

620 to 659 FICO Band – Industry CDR is 4.51% and Credit Union's 3.20%

We want to be 95% confident our sample is within 45% of true default probability

$$k = 4 / (L^2 * \text{Prior Estimator}) = 4 / (0.45^2 * 0.0451) = 197.09.$$

Thus, the credibility factor  $Z = 23 / (23 + 197.09) = 0.1045$ .

Our final CDR estimate for the 620 to 659 FICO band is equal to our company input  $(10.45\% * 3.20\%) + (1 - 10.45\%) * 4.51\%$  or 4.37%.

# DCF Is Superior to Other Models

## Why DCF is More Reliable

### **Granularity and Predictive Accuracy:**

The DCF model estimates credit losses at the loan level or detailed cohort level, using updated borrower credit scores and collateral values, offering greater predictive power than aggregate methods like WARM.

### **Prospective vs. Retrospective:**

DCF incorporates current and forward-looking data—including prepayments, defaults, and macroeconomic conditions—resulting in a more dynamic and reliable estimation of losses.

### **Transparency and Versatility:**

The DCF model is transparent, leveraging well-documented financial mathematics, and can be used for multiple business purposes, including stress testing, asset-liability management (ALM), and strategic decision-making.

# DCF Is Superior to Other Models

## Other Benefits of DCF

- **Net Economic Value (“NEV”) for ALM models.**

More importantly, credit, interest rate, and liquidity risks can be and should be measured on an integrated basis.
- **Stress Testing**

Financial institutions can run multiple iterations of adverse macroeconomic circumstances and quantify the capital they have at risk.
- **Loan Pricing Optimization**

The same iterations can be run to set all-in loan pricing to ensure the interest rate is sufficient to cover expected credit losses under adverse scenarios.
- **Strategic Adjustments and Cross-Departmental Communication**

Changes to lending strategies can be easily communicated because the same primary variables used in the model – credit score and LTV – are the same ones used to make new loans.

# Key CECL Takeaways

- Forward-Looking Approach
- Granularity Enhances Accuracy
- Model Choice Matters
- Importance of Credit and Collateral Data
- Adjustments for Macroeconomic Conditions
- Limitations of Retrospective Models
